

Improvement to tree seedling in replantation area Sakaerat.

MANUS SUJAWIPHAN and PHONGSRI BAI-ADUL.

Final report submitted to the Sakaerat Environmental Research Committee

the National Research Council., 1982.

ABSTRACT

Glyphosate application twice each year for two years to control shading and competition of water and mineral nutrition in soil of along-alang (*Imperata cylindrica* L.) can improve tree seedling in the replantation area at Sakaerat station. The application rate of 2.2 kilogram a.i. per hectare can eradicate along-alang for six months. Watering along with urea and microelement application by Drip-culture and spraying on to the tree seedling during winter and summer season (January to April) could obtain excellent growth.
